

Apprenticeship

(Prereq: Should have completed relevant courses required to work on specific projects which may include Java and SQL, Advanced Java, JavaScript, HTML/CSS courses before enrolling. If the student has finished the required courses from other training providers then a certification of completion should be furnished along with taking a test at our organisation)

This is a unique signature program from Mobi Boot Camp, in which students after finishing all the prerequisite courses can work with a mentor (an experienced developer), on a real world project to gain hands-on work experience. Students are given certain tasks to complete and will be guided with hand-holding if necessary, to complete those tasks.

The programming platform can be in any of the technologies that we teach and includes Java, JavaScript, Angular, Python, etc..

Student and Mentor will decide on the programming platform and project before the program begins and the student will be guided on a daily basis if desired, with a total of 24 contact hours.

A timesheet is kept for the contact hours and a total of 24 hrs of contact time will be covered in this program. Students are required to complete their 24 hours within 6 months. In a span of 6 months, students can work with the mentor based on their convenience. Some students tend to work all day every day whereas some others with job or family constraints connect with the mentor a few hours a day/week.

Students are advised to enroll in as many Apprentice programs as needed to complete one project at least, that is industry worthy, that the student can add to their resume.
